

ABSTRACT OF THE DISCLOSURE

A controller determines whether a transmission data amount of the image data exceeds a limit capacity of a mail server connected the electronic mail communication apparatus before an actual transmission of the image data. Further, when the transmission data amount of the image data exceeds the limit capacity of the mail server, automatic processing is performed so that an electronic mail including image data can be transmitted. Accordingly, electronic mail communication apparatus of the present invention is capable of enabling users to save a lot of time for the image transmission.
